

Taller Análisis Forense Movil Android

Sergio Andrés Linares Vargas - salinaresv@libertadores.edu.co
Fundación Universitaria los Libertadores
Maestría en Seguridad de la Información
Análisis forense digital
Bogotá, Colombia

Resumen— En el presente taller se llevó a cabo un análisis forense integral sobre un teléfono móvil Android, con expresa autorización del propietario, con el objetivo de identificar y recuperar evidencia digital relevante. Se extrajo información del dispositivo para la elaboración del informe correspondiente. El principal hallazgo fue el nivel de seguridad del dispositivo analizado, ya que, al contar con la versión 15 del sistema operativo, presenta mayores restricciones y mecanismos de protección frente a la extracción de datos.

Sin modificar la información contenida en el dispositivo, este fue aislado de la red antes de iniciar el procedimiento. Cada paso del proceso fue documentado en el archivo anexo "Documentación Forense Móvil", y la evidencia se trabajó siempre sobre copias verificadas mediante hash. La verificación final de integridad, realizada con huella digital SHA-256 de la evidencia obtenida para el CASO-2026-001, confirmó una coincidencia del 100 % con los valores registrados originalmente en el manifiesto de adquisición.

I. INTRODUCCIÓN

El análisis forense digital se define como la aplicación de principios y técnicas necesarias para la identificación, recolección, examen y análisis de datos, preservando su integridad y manteniendo una cadena de custodia confiable, con el fin de que dicha información conserve valor probatorio [1]

Dentro de la seguridad de la información, el objetivo del análisis forense digital aplicado a dispositivos móviles no es preventivo, sino investigativo y reconstructivo. A través de este se busca determinar qué ocurrió, cuándo, cómo y por medio de qué aplicaciones, procesos o canales de comunicación, ya sea para investigar delitos informáticos o reconstruir incidentes de seguridad relacionados con teléfonos inteligentes. Para ello, se requiere el levantamiento de evidencia digital tanto volátil como no volátil presente en el dispositivo —como datos en memoria RAM, procesos activos o conexiones de red— así como evidencia no volátil almacenada en la memoria interna, tarjetas SD, bases de datos de aplicaciones y registros del sistema. La evidencia volátil recibe mayor prioridad en la captura, debido a su alta probabilidad de ser modificada, sobrescrita o eliminada, especialmente en dispositivos móviles, donde procesos en segundo plano, actualizaciones automáticas y la propia actividad del usuario pueden alterarla en cuestión de segundos.

II. METODOLOGÍA

La metodología empleada para el desarrollo de este taller inició con el alistamiento de un dispositivo móvil Android, para lo cual se utilizaron las siguientes herramientas:

- ADB (Android Platform Tools) v.1.0.41
- ExifTool v.13.59_64
- DB Browser for SQLite v.3.13.1 (Win64)

Estas herramientas se emplearon para la extracción y el análisis de las evidencias, todo dentro de un entorno controlado, utilizando comandos ejecutados desde CMD o PowerShell.

En primer lugar, se aisló el dispositivo de la red, activando el modo avión, el modo desarrollador y la depuración por USB. A partir de esta configuración, se ejecutaron los comandos necesarios para realizar el triage inicial, en el cual se comprobó la conexión exitosa con el dispositivo analizado y se recopilaron procesos, archivos y valores hash. Esta información se transfirió a una carpeta denominada CASO-2026-001, ubicada en la ruta %TEMP%\taller_forense_movil\CASO-2026-001, donde quedó resguardada.

Posteriormente, para el análisis de la evidencia, se generaron dos copias adicionales dentro de la misma ruta, denominadas CASO-2026-002 y CASO-2026-003. Sobre estas copias se confirmó el valor hash correspondiente, verificando que fuera exactamente el mismo y que no se hubieran presentado modificaciones. De esta manera, se garantizó la integridad de la evidencia digital recolectada durante este ejercicio.

III. RESULTADOS

Como resultados del taller se tiene en primera instancia se realizó copia de los archivos y carpetas accesibles, Respaldo de los archivos a imagen lógica, y de cada evidencia se calcula el hash de toda la carpeta adquirida de forma reproducible, se realizó análisis de metadatos multimedia (EXIF) IMG_20260522_183059.jpg. y se culminó con La verificación final de integridad, tomada con huella digital SHA-256 de la evidencia obtenida para el CASO-2026-002, confirmando que coincide al 100% con los valores registrados originalmente en el manifiesto de adquisición. Se uso la herramienta: PowerShell

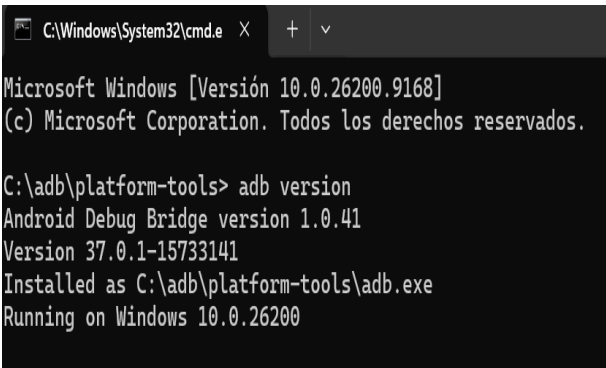

(Get-FileHash SHA256) con resultado: ok integridad verificada) con estado Intacta sin alteraciones.

IV. CONFIGURACION DEL ENTORNO

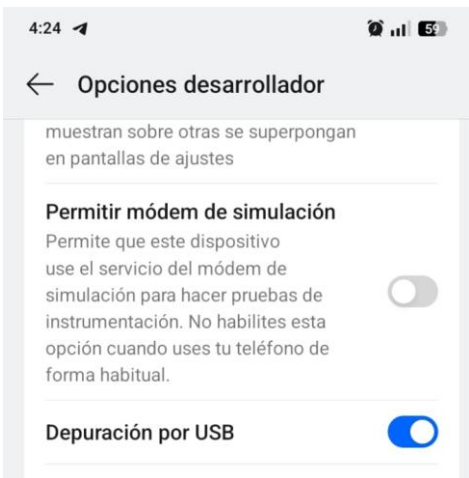

Para llevar a cabo el taller de "Análisis Forense Móvil Android", se procedió inicialmente con la instalación de ADB (Android Debug Bridge) en el equipo utilizado para el análisis, seguida de la activación de la depuración USB en el dispositivo móvil objeto de estudio. Posteriormente, se realizó la conexión física del dispositivo y su aislamiento de red, autorizando la huella digital RSA del equipo conectado: D7:C2:7C:EC:FC:CD:DB:6C:DE:5F:55:06:B2:FA:AA:E9. A continuación, se verificó la conexión mediante el comando adb devices, con el fin de comprobar la comunicación exitosa entre el computador y el dispositivo analizado. Finalmente, se configuró la adquisición de información (triage), estableciendo como ruta de destino Temp\taller_forense_movil\CASO-2026-001, carpeta en la cual se almacenó la totalidad de la información obtenida del dispositivo.

Instalación de ADB (Android Debug Bridge)

Verificación en la terminal de adb version

Activación de la depuración USB en el dispositivo

Conexión física y aislamiento de red

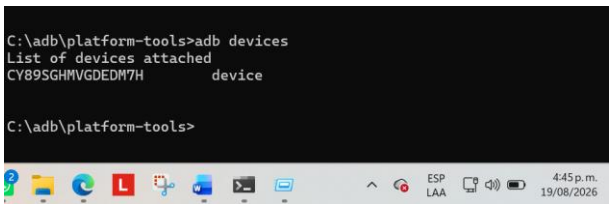

Codigo:

D7:C2:7C:EC:FC:CD:DB:6C:DE:5F:55:06:B2:FA:AA:E9

Verificación de conexión

Adb devices

V. ADQUISICION DE INFORMACION (TRIAGE)

Temp\taller_forense_movil\CASO-2026-001

Información del dispositivo

```

Se guarda como evidencia:

comando: adb shell pm list packages -f >

C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001/apps.txt

Evidencia:

Extracción de logs del sistema.

Comando: adb logcat -d >

C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001/log.txt

```
C:\adb\platform-tools>adb logcat -d > C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\log.txt
C:\adb\platform-tools>
```

Se genera reporte más completo del estado del sistema (batería, procesos, conectividad, memoria):

comando: adb bugreport

C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip

```
C:\adb\platform-tools>adb bugreport C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip
data/user/de/rom/android/shell/files/bugreports/bugreport-CPH... p: 1 file pulled, 8 skipped, 33.9 MB/s (1392003 bytes in 0.379s)
Bug report copied to C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip
C:\adb\platform-tools>
```

Se documenta el hash, realizado el reporte completo del estado del sistema.

comando: certutil -hashfile

C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip SHA256

```
C:\adb\platform-tools>certutil -hashfile C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip SHA256
50d256 hash de C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\bugreport.zip:
CertUtil: -hashfile comando completado correctamente.
C:\adb\platform-tools>
```

2.4 Copia preliminar de almacenamiento

Comando: adb pull /sdcard/

C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\sdcard_triage/

```
C:\adb\platform-tools>adb pull /sdcard/ C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\sdcard_triage/
pull: building file list...
C:\adb\platform-tools>
```

```
C:\adb\platform-tools>adb pull /sdcard/ %TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage\
pull: building file list...
C:\adb\platform-tools>
```

Se verificar que /sdcard/ tenga contenido

Comando: adb shell du -sh /sdcard/

```
C:\adb\platform-tools>adb shell ls -lah /sdcard/
total 107

C:\adb\platform-tools>adb shell du -sh /sdcard/
12G /sdcard/
C:\adb\platform-tools>
```

Se comprueba espacio:

comando: adb shell du -sh /sdcard/

```
C:\adb\platform-tools>adb shell du -sh /sdcard/
12G /sdcard/
C:\adb\platform-tools>
```

Se crea toda la estructura manualmente con el comando: mkdir

"%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage"

```
C:\adb\platform-tools>dir "%TEMP%\taller_forense_movil\CASO-2026-001"
El volumen de la unidad C es Windows-SSD
El número de serie del volumen es: 6AC9-7FEE

Directorio de C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001

6 archivos 6.791.764.354 bytes
2 dirs 818.431.324.160 bytes libres

C:\adb\platform-tools>mkdir "%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage"
```

Se copia todo /sdcard/ con el comando: adb pull /sdcard/DCIM

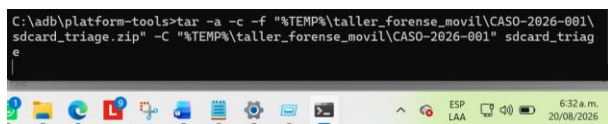

"%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage\DCIM"

```
C:\adb\platform-tools>adb pull /sdcard/DCIM "%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage\DCIM"
[ 16% ] /sdcard/DCIM/Camera/VID20251109131421.mp4: 99%
C:\adb\platform-tools>
```

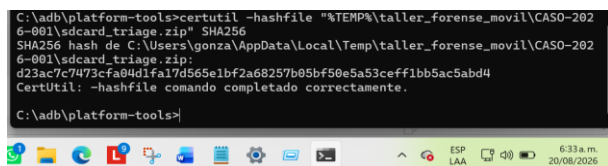

Terminación de copia /sdcard/

```
C:\adb\platform-tools>adb pull /sdcard/DCIM "%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage\DCIM"
/sdcard/DCIM/: 876 files pulled, 0 sk...9 MB/s (4376137681 bytes in 139.473s)
C:\adb\platform-tools>
```

Se obtiene el SHA-256 de la extracción completa, primero se convierte la carpeta en un archivo de evidencia ZIP con el comando: `tar -a -c -f "%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage.zip" -C "%TEMP%\taller_forense_movil\CASO-2026-001" sdcard_triage`

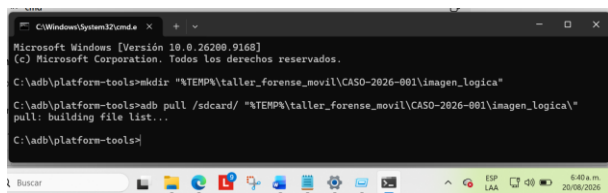

Se obtiene el SHA256 del archivo de sdcard_triage.zip
Comando: `certutil -hashfile "%TEMP%\taller_forense_movil\CASO-2026-001\sdcard_triage.zip" SHA256`

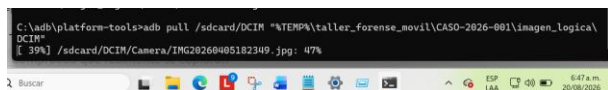

VI. ADQUISICION FORENSE (IMAGEN LOGICA, HASHING Y CADENA DE CUSTODIA)

Imagen lógica

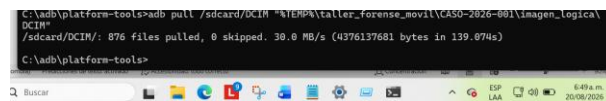

Se crea la carpeta manual con el comando: `mkdir "%TEMP%\taller_forense_movil\CASO-2026-001\imagen_logica"`
Genero la imagen lógic Comando: `adb pull /sdcard/ "%TEMP%\taller_forense_movil\CASO-2026-001\imagen_logica"`

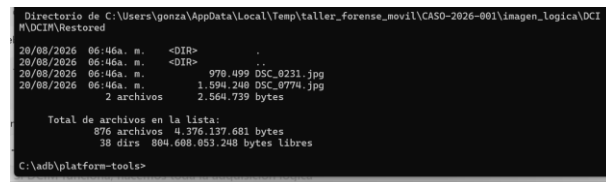

Se respalda los archivos a imagen lógica con el Comando: `adb pull /sdcard/DCIM "%TEMP%\taller_forense_movil\CASO-2026-001\imagen_logica\DCIM"`

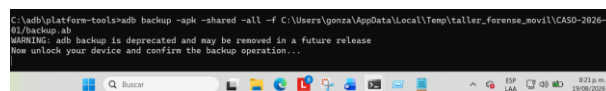

Con un resultado de 876 archivos

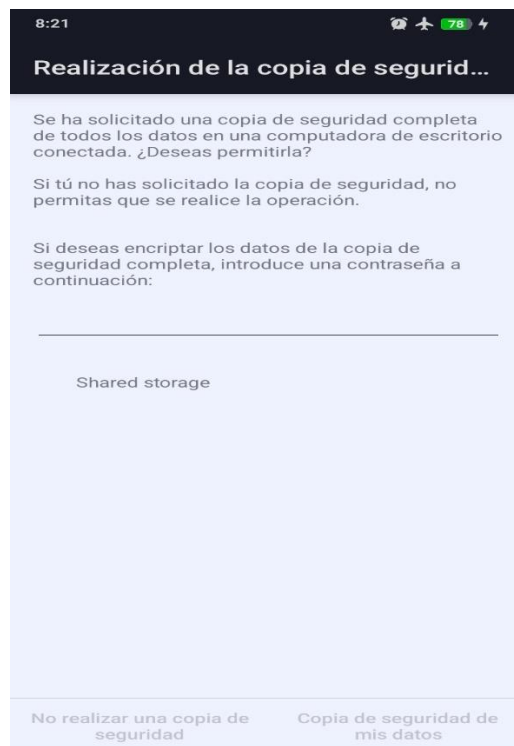

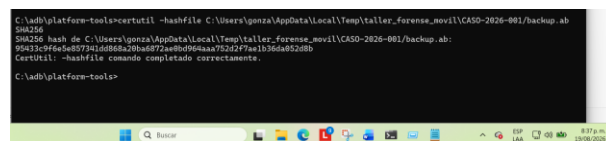

Se comprueba contenido con el comando: `dir /s "%TEMP%\taller_forense_movil\CASO-2026-001\imagen_logica\DCIM"`

Se realiza respaldo estructurado de apps y datos compartidos permitidos con el comando: `adb backup -apk -shared -all -f C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\backup.ab`

Se comprueba huella digital SHA256 de copia de los archivos y carpetas accesibles a través del sistema de archivos

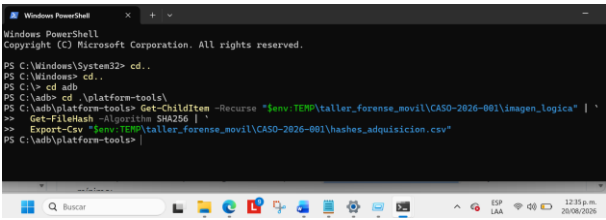

nota sobre adquisición física (nivel avanzado, fuera del alcance práctico de este taller)

se omitió este paso debido a la falta de autorización para el borrado de datos del usuario.

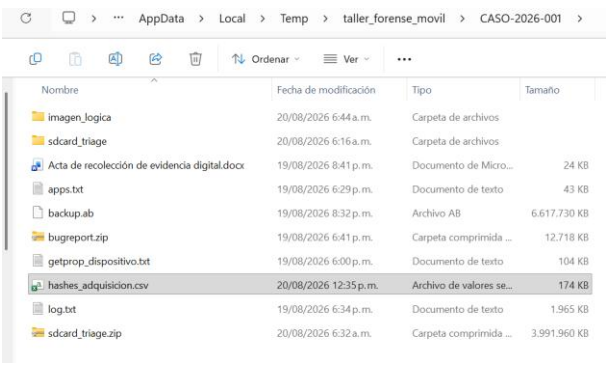

hash de integridad

Se calcula el hash de toda la carpeta adquirida de forma reproducible (recomendado sobre hashear archivo por archivo) se usa SHA-256 es el estándar recomendado actual (NIST, SWGDE)

comando: `Get-ChildItem -Recurse "$env:TEMP\taller_forense_movil\CASO-2026-001\imagen_logica" | Get-FileHash -Algorithm SHA256 | Export-Csv "$env:TEMP\taller_forense_movil\CASO-2026-001\hashes_adquisicion.csv"`

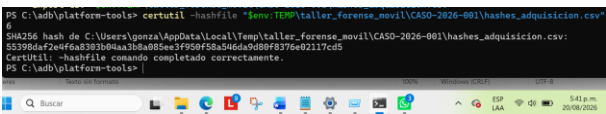

Evidencia de creación de archivo

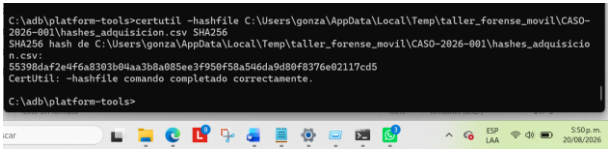

Cadena de custodia

Se registra en la plantilla “Formato de cadena de custodia de evidencia digital.docx” Hash SHA-256 la evidencia adquirida comando: `certutil -hashfile "$env:TEMP\taller_forense_movil\CASO-2026-001\hashes_adquisicion.csv" SHA256`

Se recalcula el hash de la carpeta de evidencia.

Comando: `certutil -hashfile C:\Users\gonza\AppData\Local\Temp\taller_forense_movil\CASO-2026-001\hashes_adquisicion.csv SHA256`

Se compara contra el hash documentado al momento de la adquisición.
hash 55398daf2e4f6a8303b04aa3b8a085ee3f950f58a546da9d80f8376e02117cd5
se determina : "integridad verificada"

VII. ANALISIS DE LA EVIDENCIA EXTRAIDA

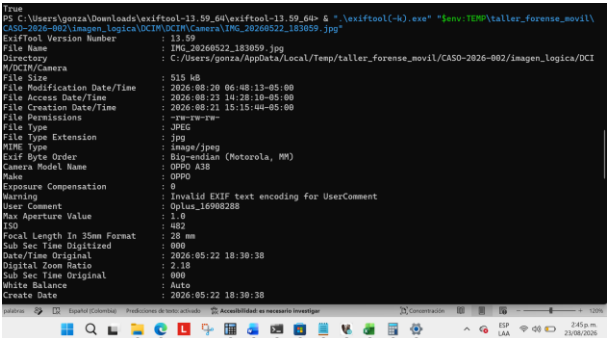

Análisis de bases de datos SQLite

El análisis de contactos fue omitido debido a que el dispositivo analizado correspondía a un celular con Android 15. A partir de la versión 10, Android reforzó considerablemente sus mecanismos de seguridad, lo cual impide la extracción de contactos mediante los métodos empleados en este taller.

Análisis de metadatos multimedia (EXIF)

Ubicación de imagen a analizar:

La verificación final de integridad, tomada con huella digital SHA-256 de la evidencia obtenida para el CASO-2026-002, confirmando que coincide al 100% con los valores registrados originalmente en el manifiesto de adquisición. Se uso la herramienta:PowerShell (Get-FileHash SHA256) con resultado: ok integridad verificada) con estado Intacta sin alteraciones

VIII. CIERRE DEL CASO E INFORME PERICIAL

Se realiza el cierra la conexión ADB con el comando adb kill-server, se desactiva la depuración usb en el dispositivo móvil, se realiza el recalcu del hash en la carpeta completa de evidencia el cual coincide con el registrado en la cadena de custodia.

Hash SHA-256 de la evidencia al momento de la adquisición	55398daf2e4f6a8303b04aa3b8a085ee3f950f58a546da9d80f8376e02117cd5
Algoritmo y herramienta usada para el hash	SHA-256

Elaboración del informe pericial

Se elabora el informe pericial el cual se encuentra en la carpeta repositorio con el nombre CASO-2026-001\Informe pericial de análisis forense digital.pdf"

IX. CONCLUSIONES

El desarrollo de este taller permitió comprobar que el análisis forense en dispositivos móviles Android modernos enfrenta limitaciones técnicas significativas frente a versiones anteriores del sistema operativo. En particular, el dispositivo analizado (Android 15, nivel de API 35) restringió por completo la extracción de contactos mediante ADB, evidenciando que los mecanismos de protección de datos personales implementados a partir de Android 10 se han fortalecido de forma progresiva. Esto confirma que, en escenarios sin acceso root ni herramientas forenses comerciales especializadas, el perito debe ajustar su metodología a la evidencia efectivamente accesible —en este caso, archivos multimedia, metadatos EXIF, listado de aplicaciones, logs del sistema y propiedades del dispositivo— sin que ello comprometa la validez del proceso siempre que se documente adecuadamente cada limitación encontrada.

Por otra parte, el ejercicio demostró la importancia de aplicar rigurosamente los principios de la cadena de custodia digital, incluso en un entorno académico controlado. El uso sistemático de hashes SHA-256 en cada etapa —desde la adquisición inicial hasta la verificación final sobre las copias de trabajo— permitió constatar una integridad del 100 % en toda la evidencia recolectada, validando que el flujo de trabajo empleado (aislamiento de red, triage, imagen lógica, análisis de metadatos y verificación criptográfica) es reproducible y confiable. Esto refuerza que, más allá de las herramientas específicas utilizadas, es la disciplina metodológica —documentar cada paso, trabajar siempre sobre copias verificadas y nunca sobre la evidencia original— la que otorga valor probatorio al resultado final de un análisis forense digital.
